

Octa Light Player™ - Light Viewing Booth Retrofit Option

Product Description

Telelumen's Octa Light Player is uniquely suited to viewing booths for critical color and light quality control applications. We have a trim vertical mount desktop luminaire as well as the option to upgrade existing booths to Light Player technology. Octa Light Players have been successfully adapted to GTI, X-Rite, and custom booths. This allows the customer to use the complementary infrastructure built around a particular type of booth.

Capable of reproducing many variations of tungsten and other lighting, the Octa Light Player is also capable of producing CIE Illuminants including A, D50, and D65. There are no white light LEDs in our light players, just colors of the rainbow (see below).

Customers can choose from shipping an existing light booth to Telelumen for upgrading or have Telelumen supply a complete system including custom versions including a divider in larger booths for A/B comparisons not possible in traditional booths.

The Recording and Playback of Light
